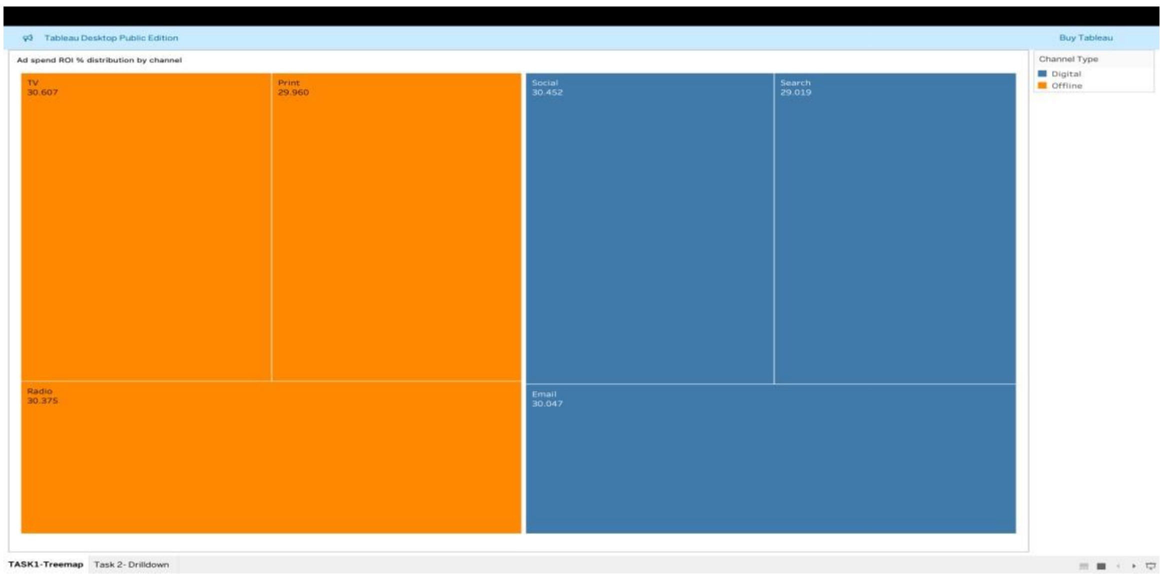
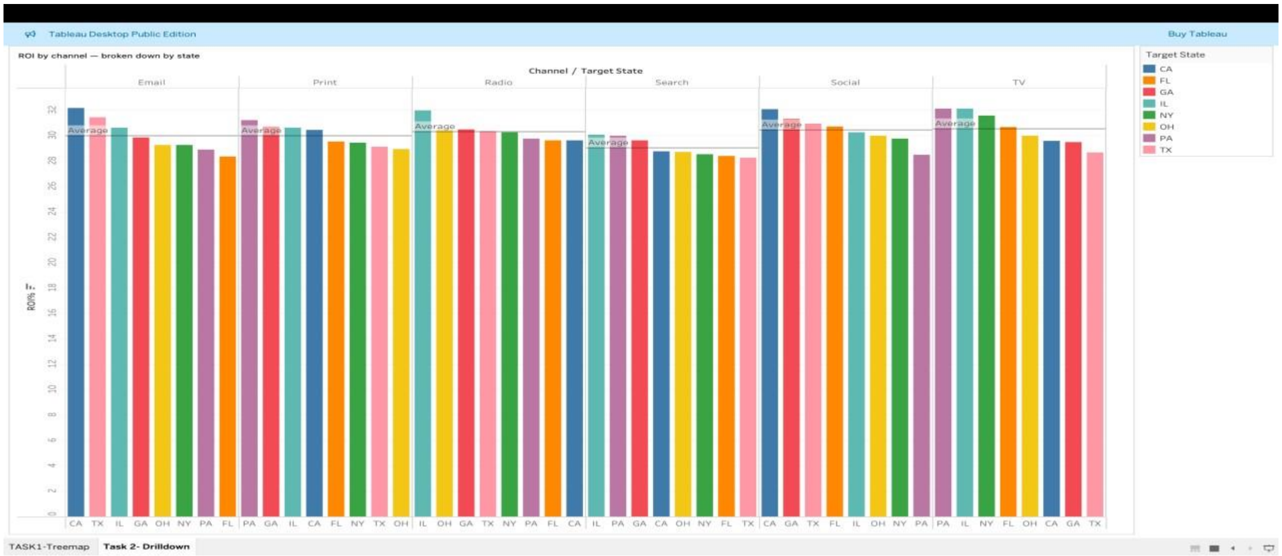
Task 1



Managerial Decision

A senior marketing manager can use this to decide whether to shift overall budget between Digital and Offline as a strategy. Since ROI is slightly higher for Offline and spend is evenly split, the case could be made to reallocate budget toward TV and Radio at the expense of Search.

Task 2



Managerial Decision

A regional marketing manager can use this to make geo-targeted spend decisions. for example, reduce Search budget in TX and FL where it consistently underperforms, and reinvest in Social or TV in those same states where ROI is 2–3 points higher.

How hierarchical structure influenced interpretation:

- Moving from Channel Type → Channel → State created a natural top-down reading flow
- Each level added a new layer of context without overwhelming the viewer at once
- The hierarchy guided managers to first form a high-level opinion, then drill down to validate or challenge it

Where aggregation helped and where it could obscure insight:

- Helped: channel-level averages gave a clean, actionable ranking that is easy to present to leadership
- Helped: grouping by Channel Type reduced complexity and highlighted the Digital vs. Offline split clearly
- Obscured: state-level variation of 3–4 percentage points is completely invisible in the treemap alone
- Obscured: equal spend across channels in the treemap implies equal performance, which is misleading given Search's consistent underperformance
