- Assignment Due Date: March 4, 2026

1. Which departments face the highest combined likelihood and impact of risks, and how large are the potential financial losses associated with them?

How multiple variables were represented

- X-axis: Impact Score (severity of risk)
- Y-axis: Likelihood Score (probability of risk occurring)
- Color: Risk Category (Financial, Operational, Strategic)
- Bubble Size: Estimated Financial Loss
- Each point: Represents a risk affecting a specific department

Why this visualization type was selected

- A scatter plot allows comparison between two quantitative variables (likelihood and impact).
- Color encoding helps distinguish different categories of risks.
- Bubble size adds another dimension by showing financial exposure.
- This multivariate design allows multiple risk characteristics to be analyzed simultaneously in a single view.

Managerial insights

- Risks appearing in the top-right region have both high likelihood and high impact and should be prioritized.
- Larger bubbles indicate risks with higher potential financial losses.
- Clusters of points suggest areas where multiple departments face similar risk levels.
- Managers can use this visualization to prioritize mitigation strategies and allocate resources to the most critical risks.

Risk Trends over time

How multiple variables were represented

- X-axis: Time (Quarter) showing the progression of risk assessments.
- Y-axis: Average Risk Score Total representing the overall level of risk.
- Color: Risk Category (Financial, Operational, Strategic).
- Lines: Each colored line tracks how a specific risk category changes over time.

Why the selected visual form is appropriate

- A line chart is ideal for analyzing changes and patterns across time.
- It allows easy comparison of multiple risk categories simultaneously.
- The continuous timeline helps reveal trends, fluctuations, and risk spikes.
- Color coding improves readability and helps distinguish risk types.

Managerial insights

- Managers can observe how risk levels evolve across different quarters.
- The chart highlights periods where risk scores increase or decrease, signaling potential operational changes.
- Differences between the lines show which risk categories are becoming more prominent over time.
- This helps decision-makers monitor risk trends and adjust mitigation strategies proactively.
